Overall Dimensions and Mounting Interface

PARAMETER	VALUE	UNIT
Nominal diameter	24	mm
Body diameter D	50	
Diameter d0	24	

- Confirm the selected series, structure configuration and exact SKU before using dimensions or interface geometry.
- Keep mounting faces flat, clean and free of burrs, raised holes, debris and coating buildup.
- Reserve assembly, lubrication, inspection and removal access around the screw, nut and support interfaces.

Screw, Nut and Support Load Path

LOAD RATING	CONFIGURATION	LOAD	UNIT
Rated dynamic load Ca	Selected configuration	**74**	kN
Rated static load Coa	Selected configuration	**112**	kN

- Route axial force through the specified screw, nut, support bearing and host structure; include offset, gravity, acceleration, shock and emergency-stop cases.
- Validate axial, radial and moment loads with the host guide, support stiffness and actual duty cycle; do not infer system capacity from diameter alone.
- Use a specified support and guide arrangement to limit bending, tilt and parasitic side load throughout the stroke.

Lead, Precision, Preload and Alignment

PARAMETER	VALUE	UNIT
Ball Screw Lead	6	mm
Thread count N	3	
Diameter d0	24	mm

- Use the lead and applicable precision data when validating speed, resolution, positioning and reversal behavior.
- Confirm preload state, nut orientation, concentricity, parallelism and datum position for the exact configuration; do not substitute another structure.
- After assembly, run at low speed and low load to check friction, noise, temperature and smooth travel before normal duty.

Speed, Thermal and Life Boundaries

PARAMETER	VALUE	UNIT
Forward theoretical efficiency η	0.84	ratio
Reverse theoretical efficiency η'	0.81	

- Calculate average and peak speed and axial load from the complete acceleration, constant-speed, deceleration, dwell and reversal cycle.
- Validate speed, heat generation and temperature using the installed support, lubricant, enclosure, ambient condition and complete duty cycle.
- Validate design life against axial load, speed, shock, lubrication, support, alignment, temperature and contamination.

Lubrication, Contamination and Service

- Use only the current lubricant, fill method and maintenance interval for the exact configuration. Do not mix incompatible lubricants.
- Prevent chips, fibers, cleaning residue and moisture from entering the roller tracks and nut assembly.
- Reserve assembly, lubrication, inspection and removal access around the screw, nut and support interfaces.

Commissioning and Motion Validation

- Commission in stages with supports, guides, limits and guards installed; verify each boundary before increasing speed or load.
- At low energy, verify lead direction, command polarity, travel limits and position feedback before full-power operation.
- Stop and inspect after binding, impact, abnormal noise, rising temperature, unexpected friction or loss of positioning behavior.
